

Project Premise

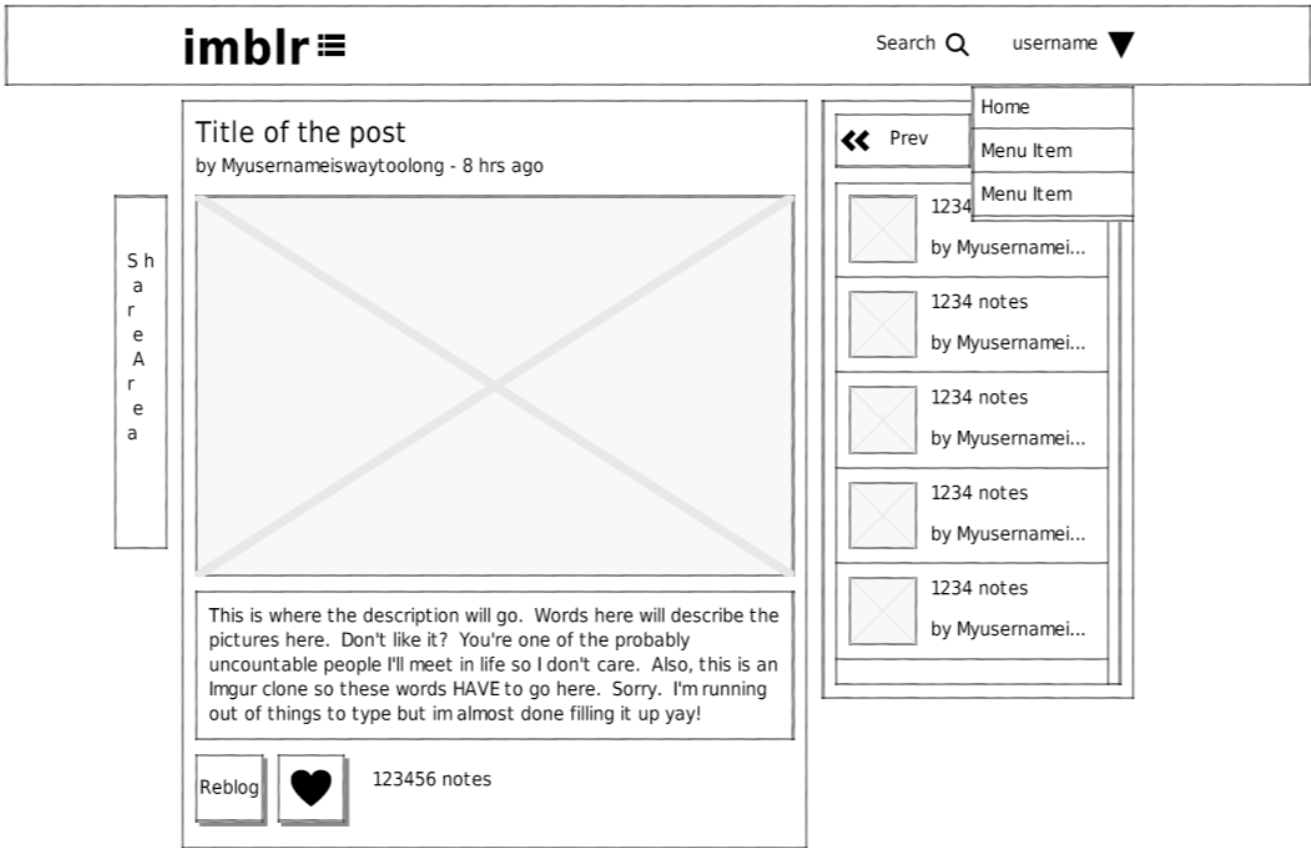

Imgur is a popular image sharing website where users can submit images and image albums with accompanying title and description. It is build to be easy to navigate through various posts by using the left and right arrow keys to flick through the collection of submitted material. I wanted to take this functionality and easy-viewing dynamic to Tumblr with my theme project.

The Wireframe

I wanted to take Imgur and subtract any functionality that would not carry over to Tumblr, such as commenting or voting.

Main wireframe, basically Imgur stripped of voting and commenting

Wireframe detailing the dropdown menu

The Design

With the static design, though the CSS was not copied from Imgur, the sizes for each image and container were matched perfectly using chrome's debugger. Reblogging and favoriting were removed as they didn't fit well with the design.

Complete layout of design

Design with menu dropped on mouse-over

Additional Notes

Towards the end of the project, I ran into the issue that Tumblr's markup doesn't allow the functionality of my design. I was not able to fix this issue, as I could not come up with any way to make this work. However, the design otherwise perfectly matches that of Imgur.
